# Functions, Classes, and Structured Error Handling in Python

## Introduction

This document presents an in-depth overview of a Python script developed for managing course registrations. The script features a menu-driven interface that allows users to register students, display current enrollments, and save data to a JSON file. The script builds on previous assignments by incorporating functions, classes, error handling strategies, and the separation of concerns, which all contribute to overall maintainability and robustness. Specific examples are presented to demonstrate its execution in both PyCharm IDE and Windows Command Prompt environments.

# **Creating the Script**

### Overview

The script implements a course registration system enabling users to register students, display current enrollments, and save the data to a JSON file through structured functions. It is organized into two main classes, "FileProcessor" for managing file operations and "IO" for handling user input and output, which promotes modularity and maintainability throughout the code. The "FileProcessor" class is shown below in Figure 1.

```
file = open(file name, "r")
student data = json.load(file)
file.close()
IO.output error messages("\n!!! JSON file must exist " \
IO.output error messages("\nThere was a non-specific error!", e)
if not file.close():
    file.close()
json.dump(student data, file)
file.close()
IO.output student courses(student data)
IO.output error messages("\nPlease check that data is valid JSON \
IO.output error messages("\nThere was a non-specific error!", e)
    file.close()
```

Figure 1: "FileProcessor" Class

The "IO" class is shown below in Figure 2.

```
class IO:
    """

A collection of presentation layer functions that manage user input and
    output.
```

```
def output error messages (message: str, error: Exception = None):
   print (message, end = "\n")
   print (menu)
        IO.output error messages(e. str ())
```

```
A function that displays current student data.
   print(f"\t{student["FirstName"]} {student["LastName"]} " \
   student first name = input("Enter the student's first name: ")
   if not student first name.isalpha():
   if not student last name.isalpha():
                    "LastName": student last name,
   students.append(student data)
                  print(f"\nYou have registered {student first name}
   IO.output error messages('\nThat value is not the correct type' \
    IO.output error messages("\nThere was a non-specific error!", e)
return students
```

Figure 2: "IO" Class

The main body of the script is shown below in Figure 3.

```
# Main body of script. Starts by reading in JSON file data.
```

```
students = FileProcessor.read data from file(file name = FILE NAME, \setminus
while True:
  IO.output menu (menu = MENU)
  menu choice = IO.input menu choice()
       students = IO.input student data(student data = students)
       IO.output student courses(student data = students)
```

Figure 3: Script Main Body

## Key Functionalities & Concepts Demonstrated

The script effectively utilizes JSON file read and write operations, functions, classes, error handling, and separation of concerns to achieve its objectives of managing student course registrations efficiently. A description of how each element contributes to the overall functionality follows.

#### JSON File Read

The "FileProcessor" class contains a static method "read\_data\_from\_file", which attempts to read student data from a JSON file ('Enrollments.json'). It uses the json.load() function to parse the contents into a list of dictionaries, allowing easy access to the student data.

#### JSON File Write

Additionally, the "FileProcessor" class has another static method, "write\_data\_to\_file", which saves the current list of student data back to the JSON file using json.dump(). This ensures that any updates to the student list are persisted between program executions.

#### **Functions**

The script is structured around several well-defined functions that encapsulate specific tasks, such as "output\_menu", "input\_student\_data", and "output\_student\_courses" in the "IO" class, and the file handling functions in the "FileProcessor" class. This modular design enhances readability and makes it easier to maintain and update the code, as changes to a specific functionality can be made without affecting the overall program flow.

#### Classes

The script is organized into two primary classes: "FileProcessor" for managing data operations (reading from and writing to the JSON file) and "IO" for handling user input and output. This object-oriented approach allows for encapsulation of related functionalities, promoting better organization and reusability of code.

#### **Error Handling**

The script employs structured error handling using try-except blocks to catch and manage exceptions that may arise during file operations and user input. For instance, it gracefully handles "FileNotFoundError" when attempting to read from a non-existent JSON file and "TypeError" when invalid data is written to the file. Custom error messages are provided through the "output\_error\_messages" method, informing users of specific issues while also displaying technical details for debugging, which enhances the robustness of the application.

#### Separation of Concerns

The design of the script exemplifies the separation of concerns by distinguishing between the data handling (via the "FileProcessor" class), user interface (via the "IO" class), and the main program logic (the loop that manages the menu and user interactions). This separation allows each component to focus on its specific role, improving code clarity and making it easier to implement changes or troubleshoot issues. For example, if modifications are needed for how data is displayed or handled, those changes can be made in the "IO" class without affecting the file processing logic.

# **Running the Script**

## Using PyCharm IDE

The 'Assignment06' script was run using PyCharm IDE using the starter 'Enrollments.json' file. Figure 4 (left) demonstrates selecting menu option "1" and entering multiple new students.

Example user input is shown in green text. Figure 4 (right) demonstrates the output when menu options "2" and "3" are chosen.

```
---- Course Registration Program -----
                                                          What would you like to do? 2
 Select from the following menu:
  2. Show Current Data
                                                              Bob Smith is enrolled in Python 100
  3. Save Data to a File
                                                              Sue Jones is enrolled in Python 100
  4. Exit the Program
                                                              Tony Hawk is enrolled in Skateboarding 900
                                                              Indiana Jones is enrolled in Intro to Archaeology
What would you like to do? 1
Enter the student's first name: Tony
Enter the student's last name: Hαwk
                                                          ---- Course Registration Program -----
Please enter the name of the course: Skateboarding 900
                                                            Select from the following menu:
                                                            1. Register a Student for a Course
You have registered Tony Hawk for Skateboarding 900.
                                                             2. Show Current Data
---- Course Registration Program -----
                                                             3. Save Data to a File
 Select from the following menu:
                                                             4. Exit the Program
  2. Show Current Data
  3. Save Data to a File
                                                          What would you like to do? 3
  4. Exit the Program
What would you like to do? 1
                                                              Bob Smith is enrolled in Python 100
                                                              Sue Jones is enrolled in Python 100
Enter the student's last name: Jones
                                                              Tony Hawk is enrolled in Skateboarding 900
Please enter the name of the course: Intro to Archaeology
                                                              Indiana Jones is enrolled in Intro to Archaeology
```

Figure 4: 'Assignment06' Menu Selections "1" thru "3".

Figure 5 shows the program output when menu option "4" is chosen and the program is exited.

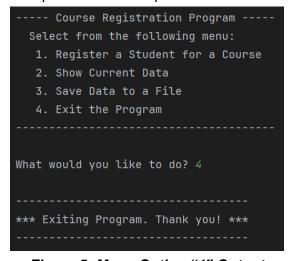

Figure 5: Menu Option "4" Output

Figure 6 shows the contents of the 'Enrollments.json' file after running the 'Assignment06' script and providing user input to register two additional students.

Figure 6: 'Enrollments.json' Data Contents after running Script

Figure 7 demonstrates error handling when incorrect menu option selections are provided. In the first scenario, a blank input was provided. In the second scenario, an alphabetic phrase was provided.

```
---- Course Registration Program -----
  Select from the following menu:
  1. Register a Student for a Course
  2. Show Current Data
  3. Save Data to a File
  4. Exit the Program
What would you like to do?
!!! Please choose a menu option (1, 2, 3, or 4). !!!
---- Course Registration Program ----
 Select from the following menu:
  1. Register a Student for a Course
  2. Show Current Data
  3. Save Data to a File
  4. Exit the Program
What would you like to do? Not an Option
---- Course Registration Program ----
 Select from the following menu:
  1. Register a Student for a Course
  2. Show Current Data
  3. Save Data to a File
  4. Exit the Program
```

Figure 7: Menu Selection User Input Error Handling

Figure 8 demonstrates error handling when incorrect user input is provided for a new student data entry. In this example, a phone number was provided instead of a first name.

```
What would you like to do? 1
Enter the student's first name: 555-555

That value is not the correct type of data!

------ Technical Error Message -----
The first name should only contain letters!
Inappropriate argument value (of correct type).
<class 'ValueError'>
```

Figure 8: Menu Option "1" User Input Error Handling

Figure 9 demonstrates error handling when the 'Enrollments.json' file is not found when initially read. To simulate this error, the file was temporarily renamed.

Figure 9: 'Enrollments.json' Read Error Handling

Figure 10 demonstrates error handling when the 'Enrollments.json' file is unable to be written to. To simulate this error, the file was set to read-only mode.

Figure 10: 'Enrollments.json' Write Error Handling

## **Using Windows Command Prompt**

Figure 11 shows running the same script using Windows Command Prompt.

```

Figure 12: JSON File Contents after running Script in Windows Command Prompt

# **Summary**

This script demonstrates a basic course registration system using Python, featuring a menu-driven interface for users to register students, display current enrollments, and save data to a JSON file. It incorporates structured error handling to manage file operations and user input validation, ensuring data integrity and providing informative feedback for various error scenarios. By organizing the code into distinct classes for file processing and user interaction, the script showcases effective programming practices for modularity and maintainability.
